# Quality assurance software

# ColorLite ColorDaTra

# ColorLite - The perfect solution to reliably control the colour quality of your products reliably.

The ColorDaTra software is a database in the field of quality assurance and is used together with the ColorLite handheld measuring instruments. It is available in two versions:

- ColorDaTra Basic
- ColorDaTra Professional

Innovative spectral Colour measurement technology "Made in Germany"

# The ColorDaTra software is the perfect complement to your ColorLite spectrophotometer

The **basic**-version offers the following functions:

- Archiving of reference colours as standards
- Visualisation of sample and production colours CIE L\*a\*b\* diagram, trend, spectrum.
- Creation of reports
- Exporting colour values to Excel<sup>©</sup> format.

The **professional**-version extends the above features by:

- Online window for direct operation of the spectrophotometer from the computer via USB.
- Additional window with standard information and a photo option
- Search function with search criteria for colour values, date, name
- Advanced colour values like metamerism index, colour strength, transparency, opacity, white and yellow index
- Extended colour distance formula DE2000, DE CMC1:2 and DE CIE94

#### Software overview

With the help of the software, measured values stored on the device can be transferred to and from a PC via USB 2.0, optionally RS232. The software works with all versions of MS-Windows<sup>©</sup> and is continuously improved. Updates are free of charge and the software can be installed on any number of PCs. A download of the test version is available on our homepage.

https://www.colorlite.de/download-center

- MS-Access© database format
- measured values are stored in "project files" on a central server and can be retrieved locally
- project files can be copied for reconciliation and sent to customers or suppliers
- and most important ... the software is easy to use!

#### Software overview

The tree view shows all standards and the corresponding samples within a colour project. To display the measured values in the main menu, it is only necessary to simply click on the standard or sample. When using ColorDaTra Professional, the measured values are automatically assigned to the selected standard.

The CIE L\*a\*b\* diagram is often used in colorimetry to show an overview of the various deviations between a standard and one or all samples. By using the changeover key, another batch can also be compared with the first batch.

This function is used for defining limit values (Pass/Fail), which are assigned to the sample.

These values and the sample status are output in the report.

- CIE L\*a\*b\*. For determination of CIE L\*, a\* and b\* limits. Sample pass/fail status is dependent on these settings. These limits remain when the standards are loaded onto the spectrophotometer.
- **CIE DE and DE2000.** For determining the Delta-E limits of samples. DE2000 limits are only available in the Professional version.
- **x,y region.** Four points can be entered to specify a tolerance range in the x,y diagram.

Am Mühlengraben 1 37191 Katlenburg-Lindau Germany

We are constantly working to improve ColorDaTra, especially the Professional version is constantly updated.

A large number of the suggestions for improvement and ideas come from you, our customers. This makes it possible to offer you software that is individually tailored to your applications. And because ColorDaTra-updates are free of charge, everyone benefits from them - even years after the purchase of their device.

You can find a free demo version on our homepage.

# Why choose ColorLite as your partner to ensure the quality of your product colours?
